

Make innovation survive contact with the installed base.

INTERVIEW THESIS | DIRECTOR, ENGINEERING - ROBOTICS & AUTOMATION

ACTUAL MANDATE

Convert market and clinical needs into scalable robotics platforms by making architecture, verification, industrialization, service, and field-learning tradeoffs visible across programs.

WHY NOW

Omnicell is advancing autonomous medication management through connected robotics, smart devices, software, services, Titan XT, and OmniSphere. The posting describes Chief Engineer-style authority across concept, architecture, verification, commercialization, deployment, reliability, and matrixed execution.

CENTRAL TENSIONS

INNOVATION VS. RELIABILITY

Advance capability without exporting risk to the installed base.

PLATFORM REUSE VS. WORKFLOW FIT

Use common architecture where it creates leverage; protect legitimate specialization.

AUTHORITY VS. MATRIX INFLUENCE

Resolve technical tradeoffs without substituting hierarchy for integration.

PRECISION VS. SCALE

Connect performance to manufacturability, supply resilience, installation, and service.

SPEED VS. EVIDENCE

Move faster through earlier, bounded evidence - not deferred uncertainty.

COMPANY MOMENT

CONNECTED ECOSYSTEM

Titan XT and OmniSphere increase the importance of coherent hardware-software boundaries, supported configurations, observability, and recovery. Company-specific operating implications remain candidate hypotheses for discovery.

Architecture-to-Field Tolerance Stack

SIX DECISIONS THAT ACCUMULATE INTO PRODUCT SCALABILITY

01 CLINICAL INTENT

Who benefits, what workflow changes, and what consequence must be controlled? Evidence: Workflow evidence, acceptance logic

02 PLATFORM ARCHITECTURE

What becomes common, configurable, isolated, or product-specific? Evidence: Interfaces, compatibility, owners

03 MECHANISM + SOFTWARE

How do mechanics, sensing, controls, software, data, and cloud behavior couple? Evidence: Failure modes, observability, recovery

04 VERIFICATION EVIDENCE

What evidence is enough for the intended release scope? Evidence: Representative conditions, traceability

05 INDUSTRIALIZATION

Can the system be built, sourced, installed, trained, and serviced repeatedly? Evidence: Build and service readiness

06 FIELD LEARNING

How does field signal become architecture and verification learning? Evidence: Normalized data, root cause, recurrence test

DECISION RULE

Proceed, bound, hold, or escalate only when the consequence, evidence standard, authority, downstream readiness, and recovery path can be discussed in the same technical decision.

Proof map and contribution profile

VERIFIED EVIDENCE SELECTED FOR THE MANDATE

ROBOTICS + INSTALLED-BASE FEEDBACK

Vape-Jet: Approximately 1,000 fielded robots; production, quality, support, telemetry, customer, and engineering issue-flow signals.

HIGH-RELIABILITY PRODUCT LEADERSHIP

Compunetics: Engineering, manufacturing, quality, customer delivery, root cause, performance measures, and process controls.

LAUNCH AND SCALE MECHANISMS

Amazon: 24/7 launch, throughput visibility, escalation, standard work, Lean/Gemba, safety, quality, and customer experience.

REGULATED AUTONOMOUS JUDGMENT

ZeusVu: Formal flight authority, chain-of-custody concepts, computer vision concepts, and 100% safety with no FAA incidents.

DECISION-SYSTEM DESIGN

DudeWorth: Automation opportunity, governance, human authority, evaluation, adoption burden, and time-to-value frameworks.

HEALTHCARE-SPECIFIC RAMP

Pharmacy context is earned through pharmacists, nurses, technicians, quality leaders, service teams, and customers. Adjacent experience is used to accelerate systems reading - never to claim clinical equivalence.

First 120 days and executive questions

EARN CONTEXT FIRST, THEN IMPROVE DECISION QUALITY

0-30 | ESTABLISH SYSTEM TRUTH

Clinical/workflow context, portfolio architecture, field/service patterns, decision rights, build and supply constraints.

31-60 | DEFINE TECHNICAL CONTRACT

Common-platform boundaries, interfaces, tolerance budgets, evidence expectations, scorecard, and review cadence.

61-90 | PROVE THE MECHANISM

Apply the Integrity Review to one next-generation concept and one recurring field reliability pattern.

91-120 | INSTITUTIONALIZE LEARNING

Connect field/service evidence to roadmap and architecture; establish next-quarter priorities and owners.

QUESTIONS THAT EXPOSE LEVERAGE

- Where should common architecture create leverage, and where must specialization remain?
- Where does technical authority become ambiguous across Product, Engineering, Quality, Manufacturing, Supply Chain, and Service?
- Which field reliability or installation burdens most constrain the next generation?
- How does OmniSphere change device architecture, supported configurations, and release ownership?
- What first-six-month technical decision would demonstrate the role's value?
- What should this leader protect even while changing direction?
