

Build the next robotics platform so innovation and reliability scale together.

JULY 16, 2026 · OMNICELL HIRING TEAM · PITTSBURGH, PENNSYLVANIA

Omnicell's next generation of pharmacy robotics will be judged by more than mechanism performance. It must translate clinical need into a coherent hardware-software system, survive verification and industrialization, deploy cleanly, and keep learning from the installed base. The opportunity in this role is to make those decisions visible across a highly matrixed organization so technical authority improves execution rather than becoming another layer of review.

Operating thesis: make architecture, verification, industrialization, service, and field-learning tradeoffs visible in the same technical decision.

My record is grounded in adjacent, consequential systems. At Vape-Jet, I work across production, quality, customer success, support, engineering issue flow, ERP, telemetry, and AI-assisted workflows in a software-enabled robotics and machine-vision environment with approximately 1,000 fielded robots. At Compunetics, I led engineering, manufacturing, quality, customer delivery, root cause, and process controls in advanced electronics and high-reliability technical programs. Amazon added 24/7 launch discipline and customer-backward operating mechanisms; ZeusVu added regulated autonomous-systems judgment and a 100% safety record with no FAA incidents.

I would bring that evidence to Omnicell with the discipline to learn pharmacy context from pharmacists, nurses, technicians, service teams, quality leaders, and customers. The goal would not be to import an external playbook. It would be to help establish the technical contract the portfolio needs: clear architecture boundaries, visible tradeoffs, sufficient evidence, manufacturing and service readiness, and a closed path from field signal back to product decision.

My independent candidate vision at <https://russelldudek.github.io/OmniCell/> makes that reasoning inspectable through an interactive Architecture-to-Field Tolerance Stack, a first-120-day plan, and an Integrity Review. These are candidate hypotheses for discussion, not claims about Omnicell's undisclosed processes.

I would welcome a conversation about where common platform architecture should create leverage, where product specialization must remain, and which technical decision this leader most needs to make easier in the first six months.

Carpe diem,

Russell Dudek
